

STANDARD HORIZON

VHF/FM Marine Handheld Transceiver

HX600S

SERVICE MANUAL

Specifications

General

Frequency range (MHz):	156 MHz - 163.275 MHz (Marine Band + WX Band) Channel Steps: 25 kHz
	88 MHz - 108 MHz (FM Broadcast: Receive only) Channel Steps: 100 kHz
	500 kHz - 1800 kHz (AM Broadcast: Receive only) Channel Steps: 10/9 kHz
	108 MHz - 137 MHz (AIR Band) Channel Steps: 25 kHz
Frequency stability:	± 10 ppm (-4 °F to +140 °F [-20 °C to +60 °C])
Emission type:	16K0G3E, 16K0G2B
Antenna impedance:	50 Ohms
Supply voltage:	Nominal: 7.2 V DC, Negative Ground (Battery Terminal)
Current consumption:	170 mA (Receive) 50 mA (Standby) 1.45 A (5 W Power transmit) 1.0 A (2.5 W Power transmit) 0.6 A (1 W Power transmit)
Operating Temperature:	-4 °F to +140 °F (-20 °C to +60 °C)
Case Size (W x H x D):	2.36" x 4.09" x 1.2" (60 x 104 x 30.5 mm) w/o knob & antenna
Weight (Approx):	13 oz (370g) with FNB-83, Antenna

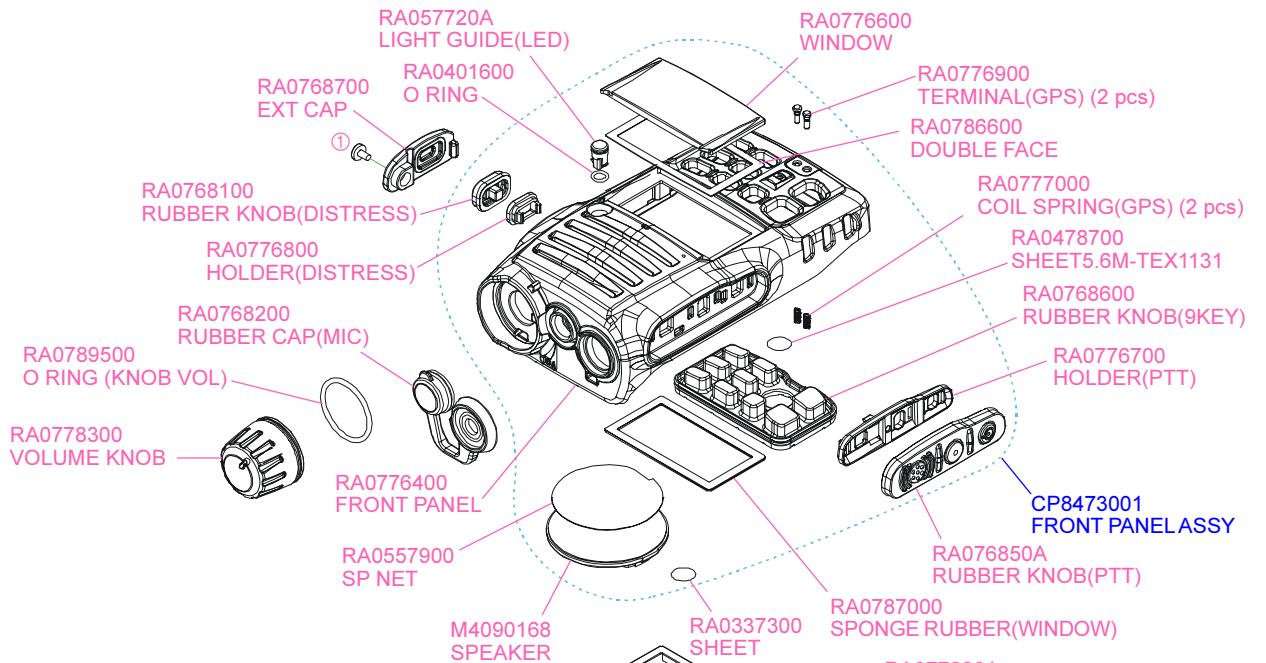

Transmitter

RF output power:	5 W/2.5 W/1 W
Modulation Type:	Variable Reactance
Max deviation:	±5 kHz
Spurious emissions:	At least 65 dB down
Microphone impedance:	2 k-Ohm

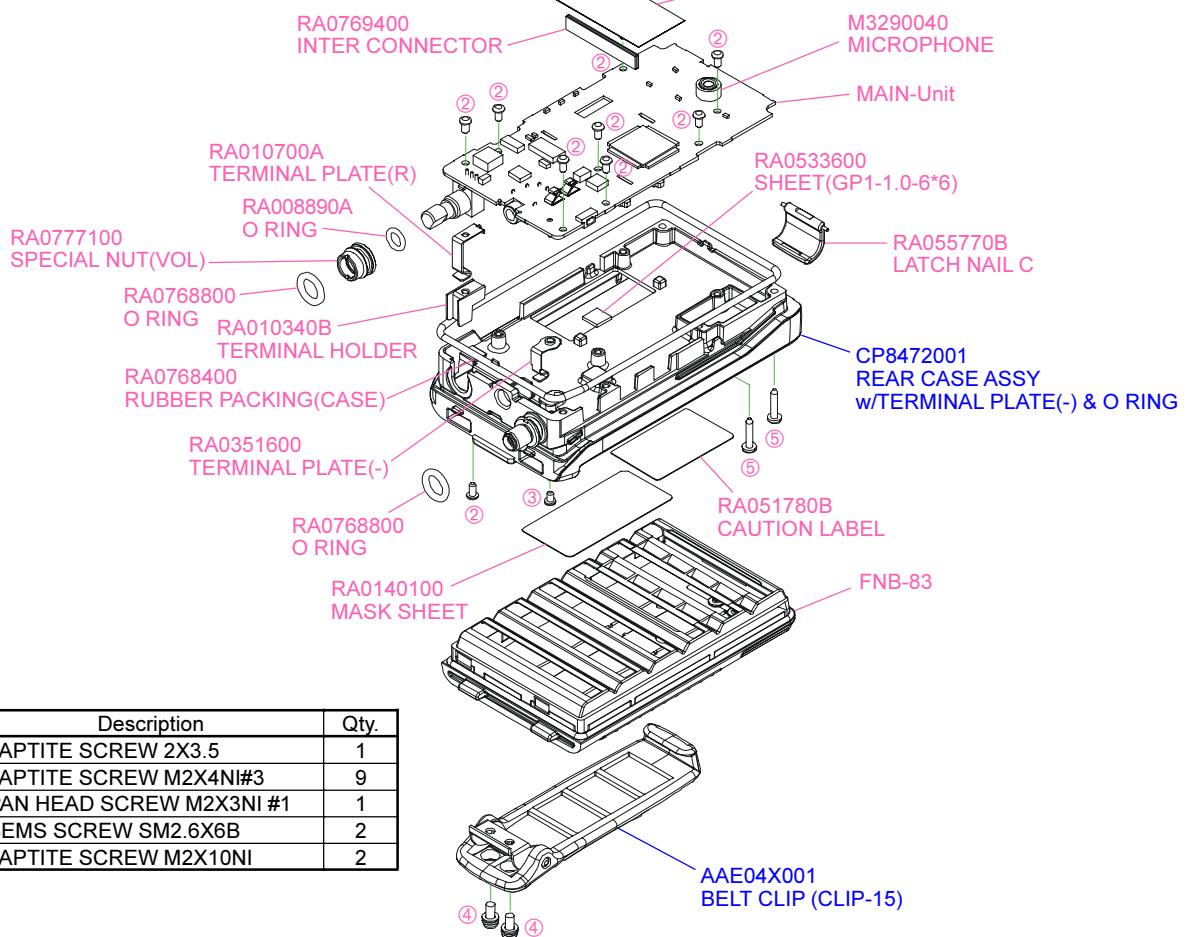

Receiver

Circuit type:	Double-conversion superheterodyne (NFM, AM) Triple-conversion superheterodyne (WFM)
Intermediate Frequencies:	NFM, AM WFM
	1st: 47.25 MHz 45.8 MHz
	2nd: 450 kHz 10.7 MHz
	3rd: - 1 MHz
Sensitivity:	0.2 µV for 12 dB SINAD (Marine Band) 0.2 µV for 12 dB SINAD (WX Band) 1 µV for 12 dB SINAD (FM Broadcast) 1 µV for 10 dB S/N (AM Broadcast) 1 µV for 10 dB S/N (AIR Band)
Adjacent channel selectivity:	65 dB (Typical)
Intermodulation response:	65 dB (Typical)
Selectivity:	25 kHz (-60 dB) (NFM, AM) 300 kHz (-20 dB) (WFM)
AF output:	700 mW @ 16 Ohm for 10 % THD (@7.4 V)

Circuit Description

1. Receive Signal Path

The **HX600S** includes two receiver front ends, each optimized for a particular frequency range and mode combination.

Duplexer

Signals between 0.5 and 1.8 MHz received at the antenna terminal pass through a first low-pass filter composed of L1039, L1040, C1300, and C1301.

Received VHF bands signals, after passing through a low-pass filter to the T/R switch circuit composed of diode switch **D1048 (RLS135)**, **D1049 (1SV307)**.

VHF Bands Reception

Received VHF bands signals pass through the Duplexer circuit, low-pass filter/high-pass filter circuit, T/R switch circuit, and protector diode **D1050 (1SS302)** before additional filtering by a high-pass filter prior to application to RF amplifier **Q1065 (2SC5555)**. The amplified RF signal is passed through the band-pass filter to first mixer **Q1042 (3SK318)**. Meanwhile, VHF output from the VCO is applied through diode Band switch **D1025 (1SS400)** and T/R switch **D1026 (DAN222)** to mixer **Q1042** as the first local signal.

The TUNE-voltage from the D/A converter **Q1014 (M62364PF)** is amplified by DC amplifier **Q1037 (2SA1774-R)** and **Q1039 (UMW1)**, and applied to varactors D1033, D1035, D1038, and D1039 (**HVC369B**), D1028, D1029, D1036, D1037, D1040, and D1041 (**1SV325**) in the variable frequency band-pass filters. By changing the electrostatic capacitance of the varactors, optimum filter characteristics are provided for each specific operating frequency.

0.5 - 1.8 MHz Reception

Received MW signals pass through the Duplexer circuit, low-pass filter circuit, protector diode **D1057 (1SS302)** before additional filtering by a band-pass filter prior to application to RF amplifier **Q1079 (2SC4915-0)**. The amplified RF signal is pass through the band-pass filter to first mixer **Q1074 (2SC4617-R)**.

Meanwhile, MW output from the VCO is applied through diode Band switch **D1024 (1SS400)** to mixer **Q1074** as the first local signal.

The TUNE-voltage from the D/A converter **Q1034** is amplified by DC amplifier **Q1037, Q1039** and applied to varactor **D1055 (KV1520)** in the variable frequency band-pass filters. By changing the electrostatic capacitance of the varactor, optimum filter characteristics are provided for each specific operating frequency.

First Intermediate Frequency (Narrow FM / AM)

The 47.25 MHz first intermediate frequency from first mixers for AM and FM-narrow signals is passed through NAR/WIDE switch **D1056 (DAP222)** and 47.25 MHz monolithic crystal filter (MCF) XF1001 to narrow IF amplifier **Q1072 (2SC4915-0)** for input to pin 16 of Narrow IF IC **Q1063 (TA31136FN)** after amplitude limiting by **D1045 (DA221)**.

Meanwhile, a portion of the output of 11.7 MHz crystal X1001 is multiplied fourfold by **Q1070 (2SC4617-R)** and **Q1077 (2SC4915-0)** to provide the 46.8 MHz second local signal, applied to the Narrow IF IC. Within the IC, this signal is mixed with the 47.25 MHz first intermediate frequency signal to produce the 450 kHz second intermediate frequency.

This second IF is filtered by ceramic filter **CF1001 (LTWC450F)** and amplified by the limiting amplifier within the Narrow IF IC before quadrate detection by ceramic discriminator **CD1001 (JTBC450C7)**.

Demodulated audio is output from pin 9 of the Narrow IF IC through narrow mute analog switch **Q1047 (2SJ364)** before de-emphasis at **Q1053 (DTC144EE)**.

The demodulated audio signal from the **Q1063** passes through a band-pass filter and squelch gate **Q1029 (NJM12902V)**.

The resulting audio is amplified by AF amplifier **Q1009 (TDA2822D)** and output through **MIC/EAR** jack J1001 to internal speaker or an external earphone.

First Intermediate Frequency (Wide FM)

The 45.8 MHz first intermediate frequency from first mixers for Wide FM signals is passed through NAR/WIDE switch **D1056** and IF amplifier **Q1080 (2SC4915-0)** and second mixer **Q1073 (2SC4915-0)**.

The 10.7 MHz intermediate frequency product of the mixer is delivered to the 10.7 MHz ceramic filter CF1002 passed through NAR/WIDE switch **D1046** for input to pin 16 of IF IC **Q1063** after amplitude.

Meanwhile, a portion of the output of 11.7 MHz crystal X1001 is multiplied threefold by **Q1082 (2SC4915-0)** to provide the 35.1 MHz second local signal, applied to the second mixer **Q1073**. Within the second mixer, this signal is mixed with the 45.8 MHz first intermediate frequency signal to produce the 10.7 MHz second intermediate frequency.

Meanwhile, a portion of the output of 11.7 MHz crystal X1001 is amplitude by **Q1070** and **Q1077** to provide the 11.7 MHz third local signal, applied to the IF IC. Within the IC, this signal is mixed with the 10.7 MHz second intermediate frequency signal to produce the 450 kHz third intermediate frequency.

Circuit Description

Demodulated audio is output from pin 9 of the Narrow IF IC through narrow mute analog switch **Q1047** before de-emphasis at **Q1053**.

The demodulated audio signal from the **Q1063** passes through a band-pass filter and squelch gate **Q1029 (NJM12902V)**.

The resulting audio is amplified by AF amplifier **Q1009** and output through **MIC/EAR** jack J1001 to internal speaker or an external earphone.

2. Squelch Control

Signal components in the neighborhood of 15 kHz contained in the discriminator output pass through an active band-pass filter composed of R1226, R1230, R1239, C1176, C1182 and the operational amplifier between pins 7 and 8 within IF IC **Q1063**. They are then rectified by **D1032** and **D1034 (DA221)** to obtain a DC voltage corresponding to the level of noise. This voltage is input to pin 16 of CPU **Q1026 (LC87F5BP8A-F56G2)**, which compares the input voltage with a previously set threshold. When the input voltage drops below the threshold, normally due to the presence of a carrier, turning on squelch gate **Q1029** and allowing any demodulated audio to pass. At the same time, **Q1002** and/or **Q1004** and/or **Q1006** goes on, causing the BUSY/TX lamp **D1009 (SDDF01000A)** to light.

3. Transmit Signal Path

Transmit/Receive Switching

Closing PTT switch S1002 pulls the base of **Q1008 (DTA144EE)** low, causing the collector to go high. This signal is input to pin 22 (PTT) of CPU **Q1026**, allowing the CPU to recognize that the PTT switch has been pushed. When the CPU detects closure of the PTT switch, pin 31 (TX/RX) goes high. This control signal is switches **Q1083 (UMD5N)**. At the same time, PLL division data is input to PLL IC **Q1027 (MB15A01PFV1)** from the CPU, to disable the receiver power saver. Also, switching **Q1076 (UMB3N)** to disable the receiver circuits. Then causing the red side of BUSY/TX lamp **D1009** to light.

Modulation

Voice signal input from either built-in microphone **MC1001 (SKB-2244S)** or external jack J1001 is pre-emphasized by C1020 and R1034, and processed by microphone amplifier **Q1010 (NJM12902AV)**, IDC (instantaneous deviation control) circuit to prevent over-modulation, and active low-pass filter.

Transmission

Modulating audio passes through deviation setting D/A converter **Q1014** to MOD of the VCO. This signal is applied to varactor **D1016 (HSC277)** in the tank circuit of VCO **Q1034 (2SC5555)**, which oscillates at the desired

transmitting frequency. The modulated VCO signal is buffered by amplifier **Q1040 (2SC5555)** and delivered through T/R diode switch **D1026**. The modulated low-level transmit signal from the VCO is applied to amplifier **Q1048 (2SC5226-5)**. The modulated transmit signal from the VCO is amplified by **Q1056 (2SK3475)** and RF power amplifier **Q1066 (2SK3476)** up to 5 W. The RF output passes through TX diode switch **D1048**. RF output is passed by T/R switch and low-pass filter to suppress harmonics and spurious products before output to the antenna at the antenna terminal.

4. PLL Frequency Synthesizer

PLL IC **Q1027** consists of a data shift register, reference frequency divider, phase comparator, charge pump, intermittent operation circuit, and band selector switch. Serial PLL data from the CPU is converted into parallel data by the shift register in the PLL IC and is latched into the comparative frequency divider and reference frequency divider to set a frequency dividing ratio for each. An 11.7 MHz reference signal produced by X1001 is input to REF pin 1 of the PLL IC. The internal reference frequency divider divides the 11.7 MHz reference by 2,340 (or 1,872) to obtain a reference frequency of 5 kHz (or 6.25 kHz), which is applied to the phase comparator. Meanwhile, a sample of the output of VCO **Q1040** is input to the PLL IC, where it is frequency-divided by the internal comparative frequency divider to produce a comparative frequency also applied to the phase comparator. The phase comparator compares the phase between the reference frequency and comparative frequency to output a pulse corresponding to the phase difference between them. This pulse is input to the charge pump, and the output from the charge pump passes through a loop filter composed of L1005, R1142, C1098, R1143, C1104, R1151, and C1110, which convert the pulse into a corresponding smoothed varactor control voltage (VCV). The VCV is applied to varactor **D1015 (1SV325)** in the VCO tank circuit to eliminate phase difference between the reference frequency and comparative frequency, and so locking the VCO oscillation frequency to the reference crystal. The VCO frequency is determined by the frequency-dividing ratio sent from the CPU to the PLL IC. During receiver power save operation, the PLL circuit operates intermittently to reduce current consumption, for which the intermittent operation control circuit reduces the lock-up time.

The **HX600S** has been carefully aligned at the factory for the specified performance across the land mobile band.

Realignment should therefore not be necessary except in the event of a component failure.

All component replacement and service should be performed only by an authorized STANDARD HORIZON representative, or the warranty policy may be voided.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts are replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized STANDARD HORIZON service technicians who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized STANDARD HORIZON service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components. Those who do undertake any of the following alignments are cautioned to proceed at their own risk.

Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, STANDARD HORIZON must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners. Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary. The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Have all test equipment ready before beginning, and follow all of the steps in a section in the order presented.

Required Test Equipment

- RF Signal Generator with calibrated output level at 200 MHz
- Deviation Meter (linear detector)
- AF Millivoltmeter
- SINAD Meter
- Inline Wattmeter with 5% accuracy at 200 MHz
- Regulated DC Power Supply: adjustable from 6 to 17 VDC, 3A
- 50-ohm Non-reactive Dummy Load: 10W at 200 MHz
- Frequency Counter: >0.1 ppm accuracy at 200 MHz
- AF Signal Generator
- DC Voltmeter: high impedance
- VHF Sampling Coupler
- AF Dummy Load: 8 ohm, 2W
- Oscilloscope
- Spectrum Analyzer

Alignment Preparation & Precautions

A dummy load and inline wattmeter must be connected to the main antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna. After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 20 and 30 °C (68 ~ 86 °F). When the transceiver is brought into the shop from hot or cold air it should be allowed some time for thermal equalization with the environment before alignment. If possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in this procedure are based on 0 dBm = 0.5 µV(closed circuit).

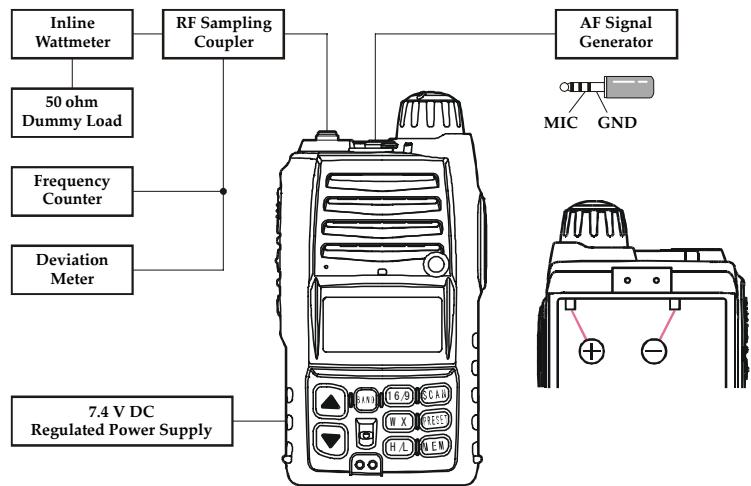

Alignment

Before Alignment

1. Press and hold in the **SQL** switch while turning the transceiver on to enter the Setup Mode.
2. Press the **SQL** switch to select the Menu item “LP”.
3. Press the [**▲**] or [**▼**] key to select the display to “oFF”, then press the **PTT** switch.
4. Set up the test equipment as shown below. Maintain the supply voltage at 7.4V DC for all steps.

PLL Reference Frequency

- Set the transceiver to CH 12, and select Low power output.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to “REF.” The transceiver now is in the PLL Reference Frequency Alignment Mode.
- Press the [**MEM**] key to enable adjustment of the PLL Reference Frequency.
- Press the **PTT** key to cause the transceiver to transmit; if necessary, press the [**▲**] or [**▼**] key to adjust the frequency to 156.600 MHz (± 100 Hz).
- Press the [**MEM**] key to exit the PLL Reference Frequency Alignment Mode.

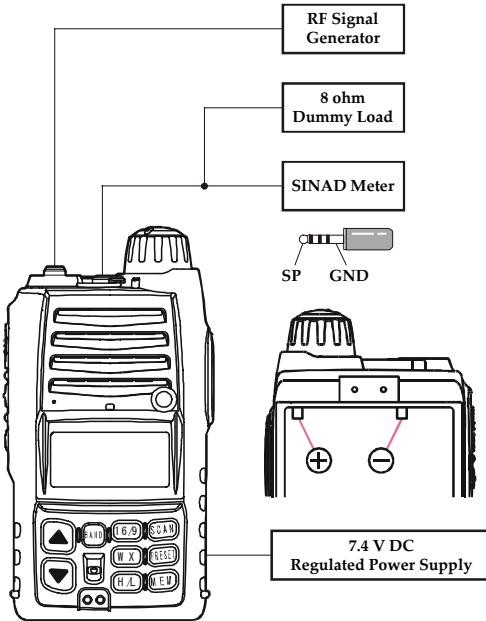

PLL & TRANSMITTER SECTION ALIGNMENT SETUP

Transmitter Power Output

Low Power Adjustment

- Set the transceiver to CH 12, and select Low power output.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to “LPOW.” The transceiver now is in the Low power output Alignment Mode.
- Press the [**MEM**] key to enable adjustment of the Transmitter Low Power Output.
- Press the **PTT** key to cause the transceiver to transmit; if necessary, press the [**▲**] or [**▼**] key to adjust the output power to 0.8 W (± 0.05 W).
- Press the [**MEM**] key to exit the Transmitter Low Power Output Alignment Mode.

RECEIVER SECTION ALIGNMENT SETUP

Mid Power Adjustment

- Set the transceiver to CH 12, and select Mid power output.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to "MPOW." The transceiver now is in the Mid power output Alignment Mode.
- Press the [**MEM**] key to enable adjustment of the Transmitter Mid Power Output.
- Press the **PTT** key to cause the transceiver to transmit; if necessary, press the [**▲**] or [**▼**] key to adjust the output power to 2.5 W (± 0.1 W).
- Press the [**MEM**] key to exit the Transmitter Mid Power Output Alignment Mode.

High Power Adjustment

- Set the transceiver to CH 12, and select High power output.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to "HPOW." The transceiver now is in the High power output Alignment Mode.
- Press the [**MEM**] key to enable adjustment of the Transmitter High Power Output.
- Press the **PTT** key to cause the transceiver to transmit; if necessary, press the [**▲**] or [**▼**] key to adjust the output power to 5.0 W (± 0.1 W).
- Press the [**MEM**] key to exit the Transmitter High Power Output Alignment Mode.

Transmitter Modulation

- Set the transceiver to CH 12, and select High power output.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to "MOD." The transceiver now is in the Transmitter Modulation Alignment Mode.
- Set the AF generator output to 50 mV rms @ 1 kHz.
- Press the [**MEM**] key to enable adjustment of the Transmitter Modulation.
- Press the **PTT** key to cause the transceiver to transmit; if necessary, press the [**▲**] or [**▼**] key to adjust the deviation to 4.2 kHz (± 0.1 kHz).
- Press the [**MEM**] key to exit the Transmitter Modulation Alignment Mode.

ATIS FSK Modulation

- Set the transceiver to CH 12, and select Low power output.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to "AT FSK." The transceiver now is in the ATIS FSK Modulation Alignment Mode.
- Press the [**MEM**] key twice, then press the [**▲**] or [**▼**] key to select the display to "FSK 2."
- Press the **PTT** key to cause the transceiver to transmit; confirm that the ATIS FSK Modulation is 2.1 kHz ± 0.3 kHz.
- If necessary, press the [**▲**] or [**▼**] key to select the display to "AT FSK", then press the [**MEM**] key.
- Press the [**▲**] or [**▼**] key to adjust the ATIS FSK Modulation is 2.1 kHz ± 0.3 kHz.
- Press the [**MEM**] key to exit the ATIS FSK Modulation Alignment Mode.

DISTRESS FSK Modulation

- Set the transceiver to CH 12, and select Low power output.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to "DS FSK." The transceiver now is in the DISTRESS FSK Modulation Alignment Mode.
- Press the [**MEM**] key twice, then press the [**▲**] or [**▼**] key to select the display to "FSK 2."
- Press the **PTT** key to cause the transceiver to transmit; confirm that the DISTRESS FSK Modulation is 3.5 kHz ± 0.3 kHz.
- If necessary, press the [**▲**] or [**▼**] key to select the display to "DS FSK", then press the [**MEM**] key.
- Press the [**▲**] or [**▼**] key to adjust the DISTRESS FSK Modulation is 3.5 kHz ± 0.3 kHz.
- Press the [**MEM**] key to exit the DISTRESS FSK Modulation Alignment Mode.

Alignment

Squelch Threshold and Tight Squelch Adjustment

N-FM Squelch Level Adjustment

- Set the transceiver to CH 12.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to “FMHS.” The transceiver now is in the N-FM Squelch Hysteresis Alignment Mode.
- Press the [**MEM**] key to enable adjustment of the N-FM Squelch Hysteresis.
- Press the [**▲**] or [**▼**] key to select the display to “00.”
- Press the [**MEM**] key.
- Set the RF signal generator output to 156.600 MHz, at a level of $-12 \text{ dB}\mu\text{V}$ with $\pm 3 \text{ kHz}$ deviation with a 1 kHz audio tone.
- Press the [**▲**] or [**▼**] key to select the display to “FMTH.” The transceiver now is in the N-FM Squelch Threshold Alignment Mode.
- Press the [**MEM**] key twice.
- Set the RF signal generator output to 156.600 MHz, at a level of $-4 \text{ dB}\mu\text{V}$ with $\pm 3 \text{ kHz}$ deviation with a 1 kHz audio tone.
- Press the [**▲**] or [**▼**] key to select the display to “FMTI.” The transceiver now is in the N-FM Squelch Tight Alignment Mode.
- Press the [**MEM**] key twice.

AM Squelch Level Adjustment

- Set the transceiver to 1100 kHz.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to “AMHS.” The transceiver now is in the AM Squelch Hysteresis Alignment Mode.
- Press the [**MEM**] key to enable adjustment of the AM Squelch Hysteresis.
- Press the [**▲**] or [**▼**] key to select the display to “00.”
- Press the [**MEM**] key.
- Set the RF signal generator output to 1100 kHz, at a level of $-8 \text{ dB}\mu\text{V}$ with 30 % modulation with a 1 kHz audio tone.
- Press the [**▲**] or [**▼**] key to select the display to “AMTH.” The transceiver now is in the AM Squelch Threshold Alignment Mode.
- Press the [**MEM**] key twice.
- Set the RF signal generator output to 1100 kHz, at a level of $+3 \text{ dB}\mu\text{V}$ with 30 % modulation with a 1 kHz audio tone.
- Press the [**▲**] or [**▼**] key to select the display to “AMTI.” The transceiver now is in the AM Squelch Tight Alignment Mode.
- Press the [**MEM**] key twice.

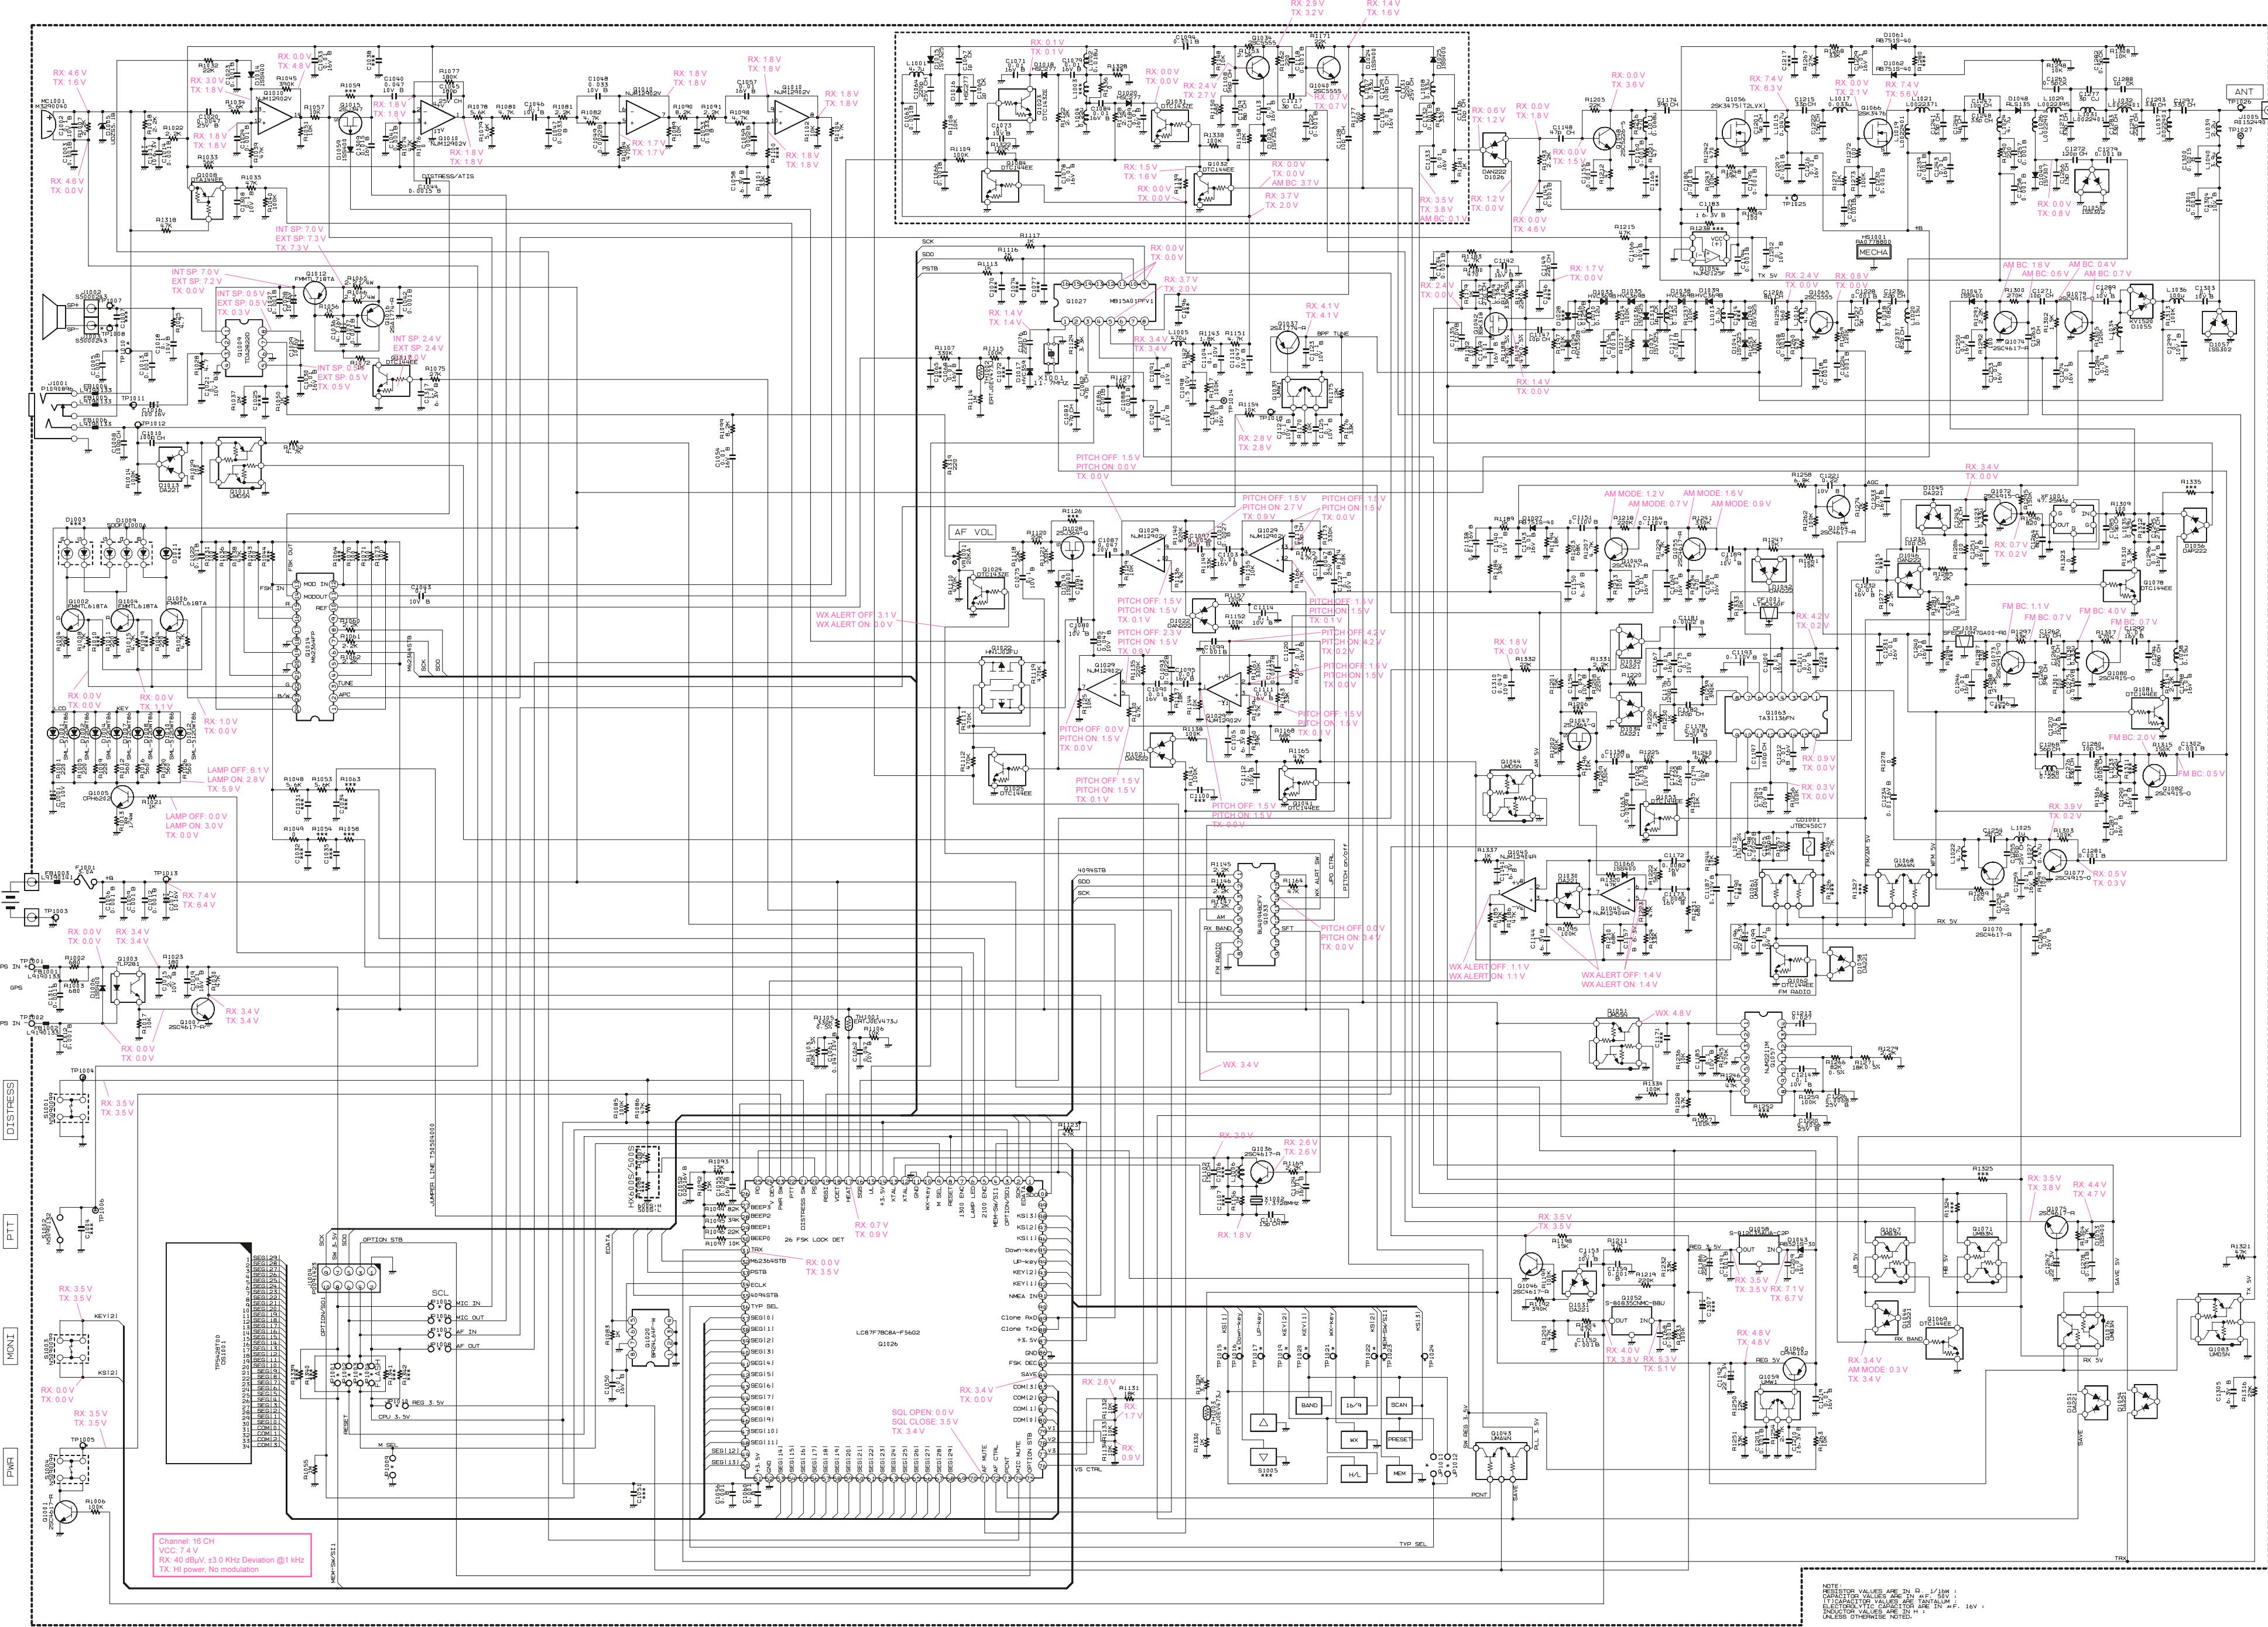

Squelch Threshold and Tight Squelch Adjustment

W-FM Squelch Level Adjustment

- Set the transceiver to 98.000 MHz.
- Press and hold in the **PTT**, **SQL**, [**▲**] and [**▼**] key while turning the transceiver on to enter the Alignment Mode.
- Press the [**▲**] or [**▼**] key to select the display to “WFMHS.” The transceiver now is in the W-FM Squelch Hysteresis Alignment Mode.
- Press the [**MEM**] key to enable adjustment of the W-FM Squelch Hysteresis.
- Press the [**▲**] or [**▼**] key to select the display to “00.”
- Press the [**MEM**] key.
- Set the RF signal generator output to 98.000 MHz, at a level of $+5 \text{ dB}\mu\text{V}$ with $\pm 22.5 \text{ kHz}$ deviation with a 1 kHz audio tone.
- Press the [**▲**] or [**▼**] key to select the display to “WFMTH.” The transceiver now is in the W-FM Squelch Threshold Alignment Mode.
- Press the [**MEM**] key twice.
- Set the RF signal generator output to 98.000 MHz, at a level of $+15 \text{ dB}\mu\text{V}$ with $\pm 22.5 \text{ kHz}$ deviation with a 1 kHz audio tone.
- Press the [**▲**] or [**▼**] key to select the display to “WFMTI.” The transceiver now is in the W-FM Squelch Tight Alignment Mode.
- Press the [**MEM**] key twice.

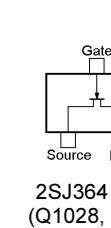

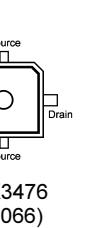

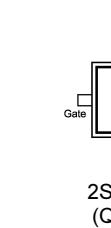

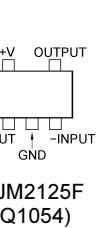

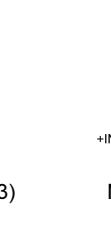

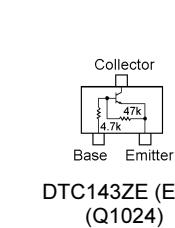

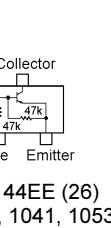

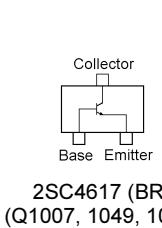

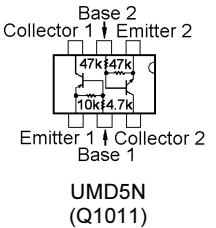

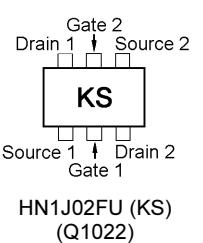

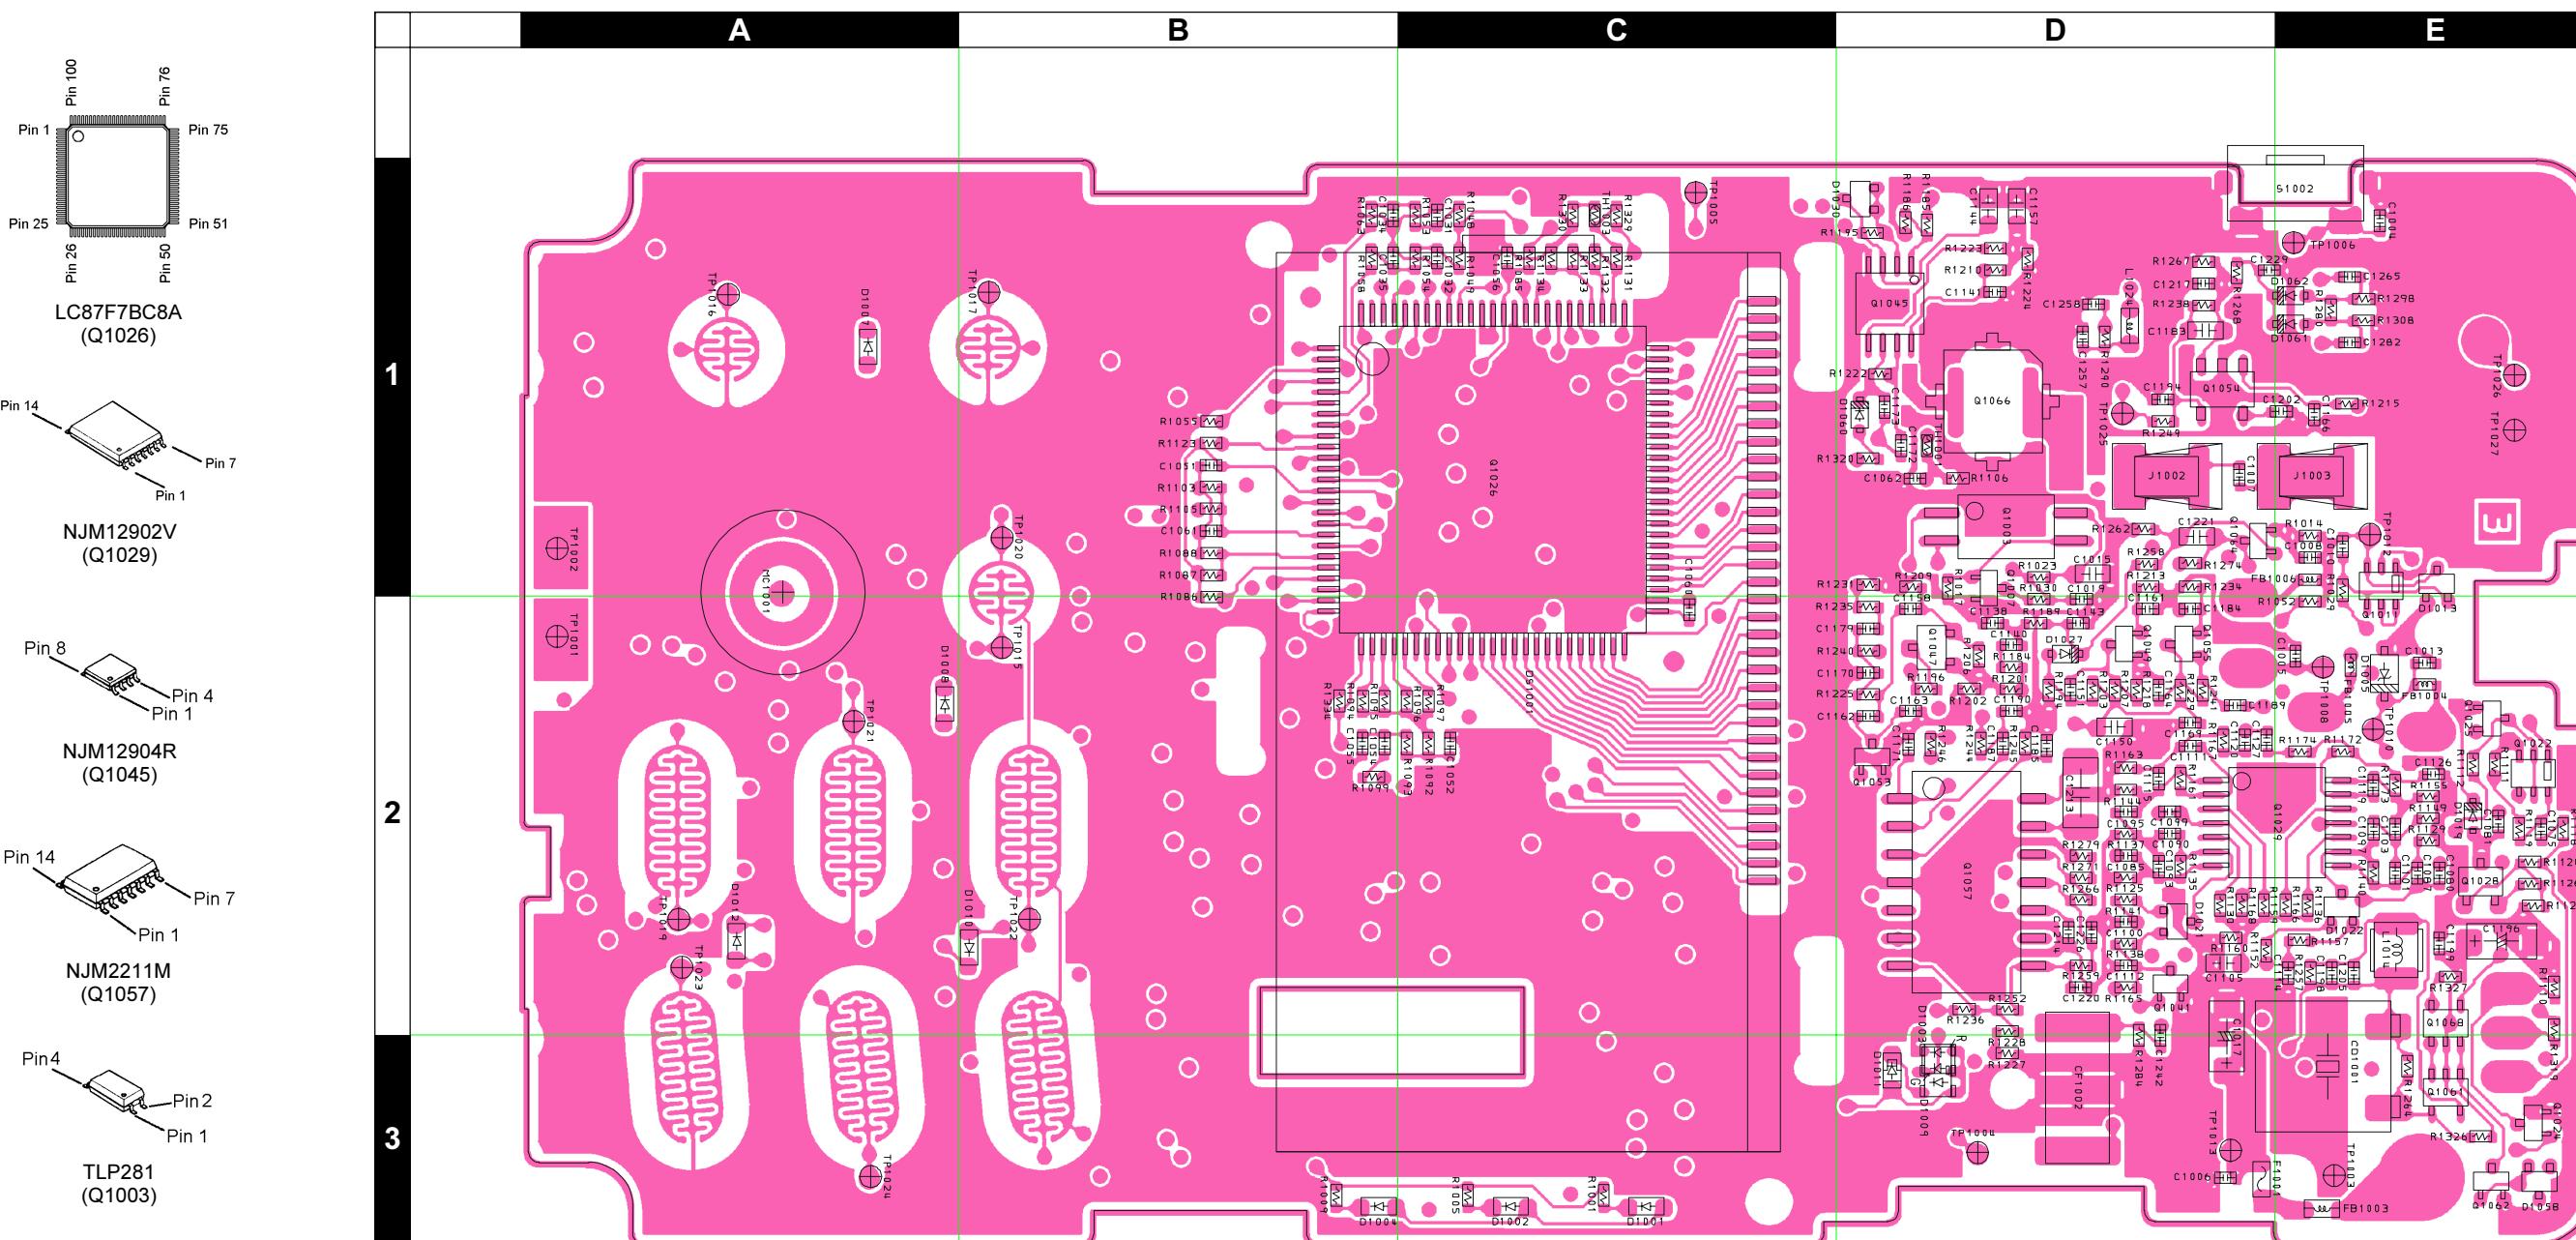

Exit from the Alignment Mode

To close the Alignment mode, just press and hold in the **POWER** switch for 2 seconds (to turn the power off). The next time the transceiver is turned on, normal operation may resume.
